

UX Analysis

Heat Mapping

A wrong click costs more than a coding mistake — it costs trust.

The Strategic Challenge

Although the landing page performs well and communicates clearly, the purchase flow still has significant friction points. Rage clicks and a relevant abandonment rate were identified during the data entry step, revealing revenue loss.

Methodology:

Quantitative analysis of the last 7 days

- **Heatmap (Clarity):** z
- **Session Recordings:** Understanding mental models and the cause of frustration

Theoretical Framework: Based on Nielsen's Heuristics and UX Articles

- **System Feedback**
- **Error Prevention**

Journey and *Breaking point*

The Journey (Landing → Purchase):

Users, mostly on desktop, explore the landing page, look for information about features and compatible banks, and move on to checkout with high conversion intent.

The Breaking Point: Friction occurs after the purchase decision, concentrated in the data form this is the moment when engagement drops and abandonment increases.

- *Error prevention heuristic*

Friction in the *data entry*

Continue instead of fill in.

Error Prevention Violation (Nielsen):

Required fields aren't clear. Users fill them out in random order and are forced to correct avoidable errors.

- 51,93% clicked "Continue"
- 3,87% clicked to fill in their name

Conclusion:

The user shows a clear goal: moving forward. Forcing reviews and unnecessary fields goes against the natural purchase flow and increases the abandonment rate.

Interface & Comunicação

We're asking for the data at the wrong time.

The User Mindset: Whoever reaches the purchase screen wants to complete the acquisition.

The Cost of Interruption: Interrupting the user in the middle of the main task (buying) with secondary demands is one of the leading causes of abandonment.

The user is in buying mode, not form-filling mode."

Physical Store Analogy: You decide to buy. When you get to the checkout, the cashier asks: 'What's your full name? ID number? ZIP code? Phone number?'

The excitement fades.

In the digital world, the user simply closes the screen.

Perception of Action

Broken Affordance: Users repeatedly click on the labels ('Full Name', 'My Phone Number') expecting to be able to type.

The clickable area is limited to the input field itself, causing frustration.

System Feedback: Active fields lack a clear visual highlight.

The current style (neutral outline) makes the field look disabled the same style used for locked fields like the Tax ID (CPF).

Micro-Friction from an Incorrect Click Target: In the sentence 'Problems with your Tax ID (CPF)? Click here,' the user tries to click on the entire sentence.

Only 'Click here' is clickable, resulting in dead clicks and loss of trust.

Recommendations

UX Tactics

Immediate actions to reduce frustration and dead clicks

Increase Click Target Area (Fitts's Law, 1954): Labels should be clickable and activate the corresponding field.

Immediate Visual Feedback: The active field should stand out clearly (colored border or inner shadow)

Expand Link Click Targets: Make entire sentences clickable ("Problems with your Tax ID (CPF)? Click here").

Optimize CTA ("Continue"): Adjust the copy to something clearer, like "I want this plan."

Recommendation *Strategic*

Question the Reason Behind Every Field::

Review the form and remove non-essential fields. Apply the concept of Minimum Viable Data (MVD) what's truly necessary at this stage of the purchase?

The right questions at the right time: Ask the right questions at the right time for example, integrate questions within an already active context. Nubank successfully applies this principle in its progressive flows.

"The timing of a question is just as important as the question itself." — Teresa Torres

The screenshot shows a mobile app interface for reviewing personal data. At the top, a blue progress bar indicates 2.21% completion. Below it, a yellow form area contains the title 'Revise seus dados pessoais' and a progress indicator with four steps: 'Revisão de dados' (active), 'Endereço', 'Dados do cartão', and 'Status do pagamento'. The form fields include 'Nome Completo', 'RG' (with a 25.97% completion indicator), 'CPF' (with a link 'Problemas com o CPF? Clique aqui'), 'País' (a dropdown menu), 'Celular', and 'E-mail' (with a link 'Problemas com o E-mail? Clique aqui'). At the bottom, a red bar contains a 64.64% completion indicator, a 'Cancelar' button, and a 'Continuar' button.
