

AI FINANCIAL ASSISTANT

UX Research · UI Design · Prototyping · AI Design · Design System

Jennifer — UX/UI Designer

6 weeks, - 2026

Financial information existed. Finding it was the real challenge.

Today, anyone using SINC has to manually cross-check statements, categories, and limits just to answer a simple question: "How much can I still spend this month?" Every question turns into navigating through menus — and the answer isn't always clear at the end.

Turn everyday financial questions into immediate answers, in natural language.

Design a conversational assistant within SINC capable of answering questions about balance, categories, and purchase history — without requiring the user to navigate through reports to find the answer.

Who will talk to the AI

Real personas will be added here — structure ready to receive the content

Marcela
35 years old · Homemaker · São Paulo

"My life is being a mom"

Married, mother of two children, and responsible for managing the household finances. Needs quick answers on her phone, without navigating through multiple screens.

FRUSTRATION
I don't have accessible and quick answers

WHAT SHE NEEDS
To have access to information in order to make financial decisions at home

WhatsApp Instagram Youtube

Jorge
25 years old · Uber driver · Rio de Janeiro

"I love traveling and being with my friends"

Freelancer. Likes video games. Has trouble controlling his own spending and struggles with simple everyday decisions — like "can I afford these sneakers this month?"

FRUSTRATION
I don't have time to look through multiple screens.

WHAT SHE NEEDS
A hub that shows him the answers, so he can make decisions.

RESEARCH & DATA

What the research showed

60%

They said they prefer to extract data by talking (in a conversation)

30%

Users already use voice chat in other apps

25%

They use the mobile app

Real data from the interviews added — clarified based on research

SOLUTION

A chat within SINC that reads the user's statement and gives simple answers about how much they can spend, where they spent it, and what to do next — with suggestion chips for common questions, and answers that turn into a visual summary when it makes sense.

AI IN THE PRODUCT

A conversation instead of three screens.

WHERE THE AI COMES IN
Personalization and automation: the AI interprets questions about budget, categories, and purchase history, and responds based on the user's real account data.

- HOW IT WORKS**
- The user asks in natural language, by text or voice.
 - The AI interprets the intent and cross-references it with the statement, categories, and limits.
 - The answer comes in text, with a visual summary when it helps with understanding.
 - The user confirms, digs deeper, or asks a new question.

NAVIGATION FLOW

From Home to the answer

FEATURES

Where the conversation makes a difference

Text or voice query

The user asks the way they'd naturally speak — "how much do I have left for food?" — and gets the answer without needing to know where that information lives in the app (which promotes greater accessibility for visually impaired users).
